

In regard to the proposed 60 meter allocation:  
I would like to see the band divided as follows:  
5250-5275 khz rtty/digital  
5275-5300 cw/qrp  
5300-5325 cw  
5350/5375 khz AM  
and 5375-5400 ssb.

All band power limitation of 200w with the exception of the qrp subband which would be 5 w.

This allocation would allow for all interests, as well as encouraging low power/weak signal communications development. Also, the general power limit would be in line with the 30m u.s. only allocation, minimizing interference with the rest of the world.
